MANUAL

DNSPrefetch

v1.0.0

Description

DNS prefetching is an attempt to resolve domain names before a user tries to follow a link. This is done using the computer's normal DNS resolution mechanism; no connection to Google is used. Once a domain name has been resolved, if the user does navigate to that domain, there will be no effective delay due to DNS resolution time.

Installation

The installation is the same as for any other modules in Magento.

1. Decompress the module right in the root of your Magento installation.
2. Clear Magento cache.
3. If you have the compiler enabled, you will have to run the compilation process.
4. You might need to logout and login again in the backend.

The module will add a new section in System > Configuration->Young-Dogs->DNSPrefetch to configure the settings for the module.

Configurations

To configure the module, login into the backend of your Magento-store and navigate to *System > Configuration > Young-Dogs > DNS Prefetch*

DNS Prefetch

Save Config

Configuration
⬆

Enabled	<input type="text" value="No"/>	[STORE VIEW]
Always prefetch	<div style="border: 1px solid #ccc; height: 100px; width: 100%;"></div>	[STORE VIEW]
	▲ Prefetch DNS of these domains (newline separated)	
Prefetch only in checkout	<div style="border: 1px solid #ccc; height: 100px; width: 100%;"></div>	[STORE VIEW]
	▲ Prefetch DNS of these domains in checkout pages (newline separated)	

Enabled Enables the module

Always prefetch Enter here the domains which you want to have prefetched. Each line one domain
Eg.: magento.com

Prefetch only in checkout Enter here the domains which you want to have prefetched only in the checkout. Each line one domain
Eg.: paypal.com
